CHAPTER XXII.

IN EXPLANATION OF THE MAPS AND SECTIONS.

MAP OF INDIA — GENERAL MAP — THE FIVE MAPS — ALTITUDES — SNOW MAP — RACE MAP — LANGUAGE MAP — FAITH MAP — POLITICAL MAP — SURROUNDING STATES — THE BOUNDARY LINE — INTERIOR DIVISIONS — ROUTES — ISOMETRIC VIEWS AND SECTIONS.

MAP OF INDIA.

102 THIS is inserted in order to give the reader, at a glance, a right impression of the relationship, in size and position, of the countries here dealt with to those with which he is likely to be more or less familiar. The adjoining sketch map of England, drawn to the same scale, will show the proportion which the Indian Peninsula bears to them, while the rectangle drawn shows what area is represented in the maps which follow. This rectangle includes the whole of the Jummoo and Kashmir territories, with small portions of the adjoining countries.

The scale of this map is 1/8000000, or an inch to 300 miles. The colouring on it shows first, by the red tint, the part that goes by the name "British India," that is to say, what is directly administered by the Government of India; secondly, by the green, the Native States other than the one we are dealing with; third, by the yellow tint, the Jummoo and Kashmir territories themselves.

GENERAL MAP.

This map (which will be found in the pocket) is on a scale of 1/1013760, or an inch to 16 miles. The selected names make it a complete map of reference for the text; but another object of it is to give, by means of a careful arrangement of outline and hill-shading, a good and true impression of the physical features. While carefully and without exaggeration representing the in-

1; Drew G-S (1862-1872) 1875 AV1 Kashmir AV1

equalities of the ground, we have done our best to make it a picture of the country. 102

The authority for by far the greater portion are the published maps of the Great Trigonometrical Survey of India. These are on a scale of an inch to four miles, with the exception that the Survey Map of part of Ladākh, not being yet ready, has been anticipated by a rougher map (a photozincograph) on the scale of an inch to eight miles; this last map (as has been mentioned in Chapter XV.) takes in a portion of country which had not been systematically surveyed; for some of this, as well as for the ground which is beyond the scope of the G. T. Survey Map, we have also consulted Mr. Hayward's Turkistān map published in the Journal of the Royal Geographical Society,* in which the valuable results of his journey to Yārkand are expressed. To the same traveller we are indebted for our knowledge of the geography of the Gilgit Valley; the information contained in his map of that country, published also by the Royal Geographical Society,† has here been incorporated. For the ground at the north-eastern part of our map, Mr. W. H. Johnson, who explored it on his way to Khutan, is the authority; the Survey zincograph map above mentioned gives the results of his exploration.

In looking at the maps of the Great Trigonometrical Survey one is apt to consider them as in some way produced by a great machine, and to pass over the individual energies that have been expended in their construction. The organization, both scientific and practical, of such a department as the Survey of India has exercised the best faculties of many minds, many minds of a high stamp, and its productions are a lasting monument to those whose lives were passed in the work. For the carrying on of the Trigonometrical observations and the mapping of the topographical details in a country of which so many parts are difficult or impossible of access, one whose most difficult places are often those most desirable to attain to for the work in hand, there has been room for the display of, and there has been displayed, by the officers of the Survey an admirable degree of perseverance and

* Journal Royal Geogr. Soc., vol. xl., 1870. † Ibid., vol. xli., 1871.

1: Drew G-8 (1862-1872) 1875 AV1 Kashmir AV1

102 endurance, and, most difficult of all, of care exercised under the endurance of the hardships of climate. The result has been a map whose foundation, of triangulation, possesses an exceeding degree of accuracy, and whose topographical detail, though in some few cases not quite exact, makes it a map of extreme value and usefulness.

To return to our own map. The eye will at once perceive that certain portions of it have been drawn in from less detailed information than the rest; these parts (which are, indeed, sufficiently marked by the difference in the style of the hill-shading) are the Chinese territory to the south-east, and a broad strip along the north of the map. It is this which was beyond the reach of the Survey for topographical examination, though even there trigonometrical observations have reached and have fixed the places of many peaks. The authorities for these outlying portions have been mentioned above, and it must be remembered that the map has there a much lower degree of accuracy, since the result of a quick journey of exploration is a very different thing from that of the systematic and long-continued work of the Survey department.

For the line denoting the boundary of the Maharaja of Kashmir's dominions I have incorporated with what has already been published some information of my own on the subject. Since this can best be discussed in conjunction with the question of the political relations of the neighbouring states, I will defer speaking in detail about it until after the consideration of the Political Map, when, under the heading "Boundary Line," the present map will again be referred to.

THE FIVE MAPS. 1/1

133* A series of five maps on one scale I have designed to illustrate different branches of the geography of the territories. Their scale is ~~1,000,000~~, or an inch to 32 miles; this is half the scale of the General Map. A feature which is common to all is the marking of the heights above the sea *in thousands*; that is to say, each whole number represents the number of thousands of feet that the place marked by it stands above the sea level. Thus 12 denotes
